ABSTRACT

Colleges collect course feedback from students so that teaching can be reviewed and improved, but the written comments are usually read one by one, if they are read at all, and it is hard to see how students feel about each teacher and course. This project presents Course Feedback Sentiment Analysis, a low-code application built on the Zoho Creator platform. Students submit feedback through a simple form with three fields: Teacher Name, Course / Subject Name and Course Feedback (multi-line text). The form has no sentiment dropdown. Instead, the application uses the native Sentiment Analysis field of Zoho Creator, a built-in Zia AI feature configured with Course Feedback as its source field, which automatically classifies every submission as Positive, Negative or Neutral. No custom machine learning model was developed or trained, and the classification does not rely on manually written keyword rules or Deluge scripts. An administrator dashboard shows the total number of feedback submissions, the Positive, Negative and Neutral counts, teacher-wise positive, negative and neutral statistics, sentiment distribution charts and teacher-wise comparison charts, and feedback reports can be filtered for closer reading. The application gives administrators a quick and consistent view of student opinion without requiring students to label their own comments or administrators to read every comment.

Keywords: Sentiment Analysis, Zia AI, Zoho Creator, Low-Code Development, Course Feedback, Student Feedback Analytics, Dashboard

CHAPTER 1
INTRODUCTION

1.1 Background

Student feedback is one of the most widely used sources of information about teaching and courses in higher education. Reviews of the research on student evaluations of teaching, such as Marsh (2007) and Spooren, Brockx and Mortelmans (2013), examine how reliable and valid such evaluations are and how they should be used. Feedback is usually collected as ratings, as written comments, or as both.

Written comments carry the most detail, but they are the hardest part of feedback to summarise. When many students comment on many teachers and courses, an administrator cannot easily tell how many comments are favourable, how many are critical, or which teachers receive more of one kind than the other. Sentiment analysis, a natural language processing task that classifies text by the opinion it expresses (Pang and Lee, 2008; Liu, 2012), can summarise such comments as Positive, Negative or Neutral.

Low-code platforms allow applications to be built mainly through visual configuration (Sahay et al., 2020). Zoho Creator is such a platform, and it provides a built-in Sentiment Analysis field powered by Zia, Zoho's AI assistant (Zoho Corporation, 2026a). This project uses that field to build a course feedback application in which the sentiment of every comment is generated automatically.

1.2 Problem Statement

Course feedback comments are written as free text, so an institution has to read them one by one to learn how students feel about each teacher and course. As the number of comments grows, this becomes slow and inconsistent. Asking students to tag their own comment with a sentiment is not a reliable alternative, because the label then depends on the student's choice rather than on the words written, and it adds another field to fill in. As a result, administrators lack a quick and consistent view of how many comments are positive, negative or neutral, both overall and for each teacher.

1.3 Objectives

- To build a simple feedback form that collects the Teacher Name, the Course / Subject Name and a multi-line Course Feedback from students.
- To use the built-in Zia Sentiment Analysis field of Zoho Creator, with Course Feedback as its source field, so that every submission is classified automatically as Positive, Negative or Neutral without any manual selection by the student.
- To maintain teacher and course data so that feedback is grouped consistently by teacher and course.
- To present the total number of submissions, the sentiment counts and teacher-wise sentiment statistics on an administrator dashboard, together with sentiment distribution and teacher-wise comparison charts.
- To provide feedback reports that administrators can filter in order to read the comments behind the statistics.

1.4 Role of Artificial Intelligence in the Project

The project uses artificial intelligence in one place: the Sentiment Analysis field of Zoho Creator. This is a ready-made Zia AI field provided by the platform. In the Course Feedback form it is configured with the Course Feedback field as its source field. When a feedback record is saved, the built-in AI feature analyses the text of Course Feedback and stores the result, Positive, Negative or Neutral, in the sentiment field of the same record.

The sentiment is therefore generated automatically by the built-in AI feature. It is not chosen by the student from a dropdown, and it is not produced by keyword lists, conditions or Deluge scripts written for this project. No custom machine learning model was developed, trained or deployed. According to the Zoho Creator documentation, the field is estimated by the platform's algorithm and appears disabled on the form so that users cannot enter a value, and sentiment analysis can currently be performed on English text (Zoho Corporation, 2026a).

1.5 Scope

In scope: submission of course feedback through a simple form, automatic sentiment classification using the Zia Sentiment Analysis field, teacher and course management,

teacher-wise sentiment statistics, an administrator dashboard with sentiment distribution and teacher-wise comparison charts, and filterable feedback reports. **Out of scope:** developing or training a custom machine learning model, rule-based or keyword-based sentiment classification, analysis of text that is not in English, numeric rating scales, aspect-level analysis of individual topics within a comment, and integration with other systems.

CHAPTER 2
LITERATURE REVIEW

The review covers four areas: student feedback in higher education, sentiment analysis, the Sentiment Analysis field of Zoho Creator, and low-code development platforms.

2.1 Student Feedback in Higher Education

Marsh (2007) reviewed research on students' evaluations of university teaching, including its reliability, validity, potential biases and usefulness. Spooren, Brockx and Mortelmans (2013) reviewed the state of the art on the validity of student evaluation of teaching. Both works treat student evaluations as a source of information that must be interpreted with care, which supports collecting feedback from many students and viewing it in summary form instead of relying on a single comment.

2.2 Sentiment Analysis

Sentiment analysis, also called opinion mining, is the computational study of the opinions and sentiments expressed in text. Pang and Lee (2008) survey its techniques and applications, and Liu (2012) describes the task at the document, sentence and aspect levels. Medhat, Hassan and Korashy (2014) survey sentiment analysis algorithms and applications, and Zhang, Wang and Liu (2018) survey deep learning approaches to the task.

Building a sentiment classifier from scratch needs labelled text, model training and evaluation, which is outside the aim of a low-code project. This project therefore uses an existing AI service and concentrates on collecting feedback and presenting its results.

2.3 Sentiment Analysis Field in Zoho Creator

Zoho Creator provides AI fields that can be added to a form. The Sentiment Analysis field determines whether the text in a single-line or multi-line field is Positive, Neutral or Negative (Zoho Corporation, 2026a). The source field must be present in the same form. Because the value is estimated by the algorithm, the field appears disabled on the form, which tells users that they cannot enter a value. The field can also be shown only to the application's administrator, and sentiment analysis can currently be performed

on English text. The field is added through the form builder by selecting the source field (Zoho Corporation, 2026b).

Using this built-in field avoids training a model, preparing labelled data and calling an external service from code, which suits a small institutional application.

2.4 Low-Code Development Platforms

Sahay et al. (2020) compared low-code development platforms, which let applications be built mainly through visual configuration instead of hand-written code. Zoho Creator provides forms, reports, dashboards and AI fields on one hosted platform (Zoho Corporation, 2026a), so the feedback form, the sentiment field and the administrator dashboard of this project can all be built and hosted in one place.

Table 2.1: Summary of Literature Review

Source	Key Finding	Use in This Project
Marsh (2007); Spooren, Brockx and Mortelmans (2013)	Reviews of the reliability, validity and use of student evaluations of teaching	Motivates collecting student feedback and summarising it carefully
Pang and Lee (2008); Liu (2012)	Survey and define sentiment analysis (opinion mining) as the classification of opinions in text	Defines the task performed by the AI field
Medhat, Hassan and Korashy (2014); Zhang, Wang and Liu (2018)	Surveys of sentiment analysis algorithms, applications and deep learning approaches	Shows the task is well established; supports using a ready-made service instead of building a model
Zoho Corporation (2026a; 2026b)	The Sentiment Analysis field labels text as Positive, Neutral or Negative; English text is currently supported	The AI component of this project
Sahay et al. (2020)	Comparison of low-code development platforms	Choice of Zoho Creator as the platform

CHAPTER 3

PROPOSED SYSTEM

Course Feedback Sentiment Analysis is a Zoho Creator application in which every student submission becomes a Course Feedback record containing the Teacher Name, the Course / Subject Name and the Course Feedback text. A Sentiment Analysis field, whose source field is Course Feedback, automatically assigns Positive, Negative or Neutral to the record. The administrator dashboard and reports then summarise the stored records.

Users of the system

- **Student:** submits course feedback through the Course Feedback form.
- **Administrator:** manages the teacher and course data and uses the dashboard and reports to review the feedback.

Teachers and courses appear in the system as data against which feedback is recorded.

How the proposed system overcomes the existing problems

- One simple form with three fields replaces unstructured collection of feedback.
- The Zia Sentiment Analysis field labels every comment automatically, so no student has to select a sentiment and nobody has to read every comment in order to classify it.
- The same built-in AI feature labels every record, so the labelling does not depend on who reads the comment.
- Teacher-wise statistics show the positive, negative and neutral counts for each teacher at a glance.
- Dashboard charts and filterable reports let administrators move from the summary to the individual comments.

3.1 Architecture Diagram

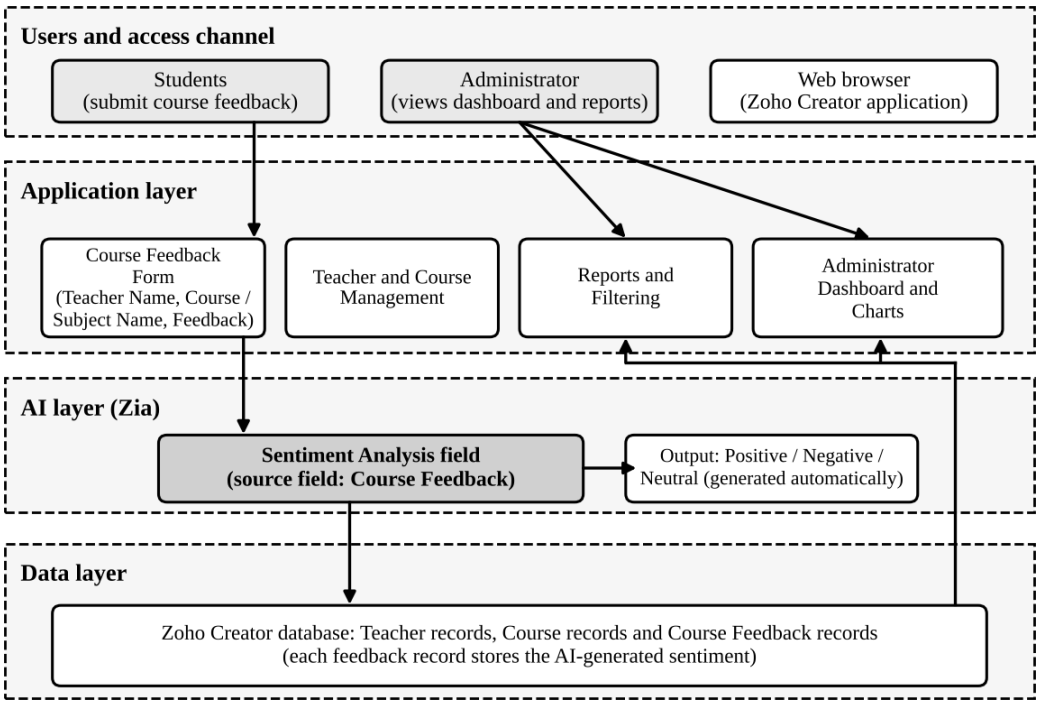

Figure 3.1: Architecture Diagram of the Course Feedback Sentiment Analysis System

Users and access channel. Students submit feedback, and the administrator opens the dashboard and reports, through a web browser.

Application layer. Zoho Creator hosts the Course Feedback form, the teacher and course management forms, the feedback reports and the administrator dashboard.

AI service layer. The Sentiment Analysis field is a built-in Zia AI field of Zoho Creator on the Course Feedback form, with Course Feedback as its source field. It generates Positive, Negative or Neutral automatically. No custom machine learning model, keyword rules or Deluge scripts are used for the classification.

Data layer. Teacher, Course and Course Feedback records, including the generated sentiment, are stored in the Zoho Creator database. The reports and the dashboard read these records to produce lists, counts and charts.

3.2 Data Model

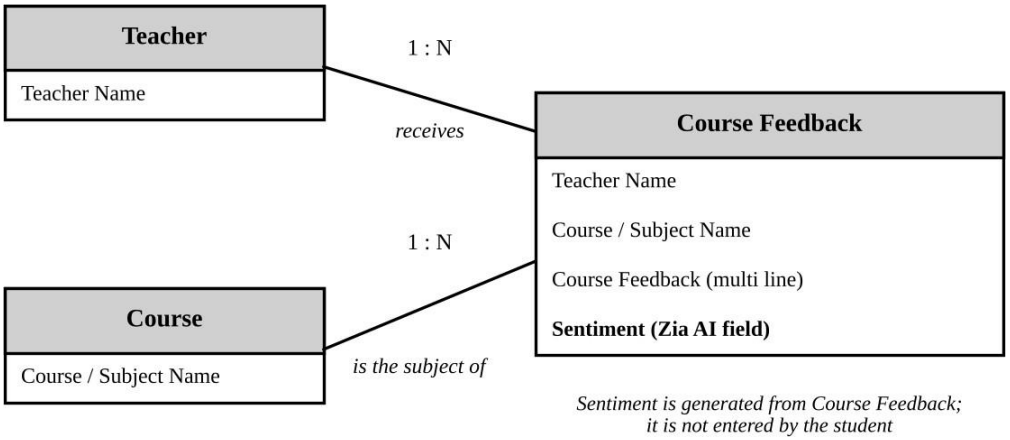

Figure 3.2: Data Model of the Application

Figure 3.2 shows the data model. A teacher can receive many feedback records and a course can be the subject of many feedback records. Each Course Feedback record stores the Teacher Name, the Course / Subject Name, the Course Feedback text and the Sentiment value generated by the Zia field.

3.3 Process Flow

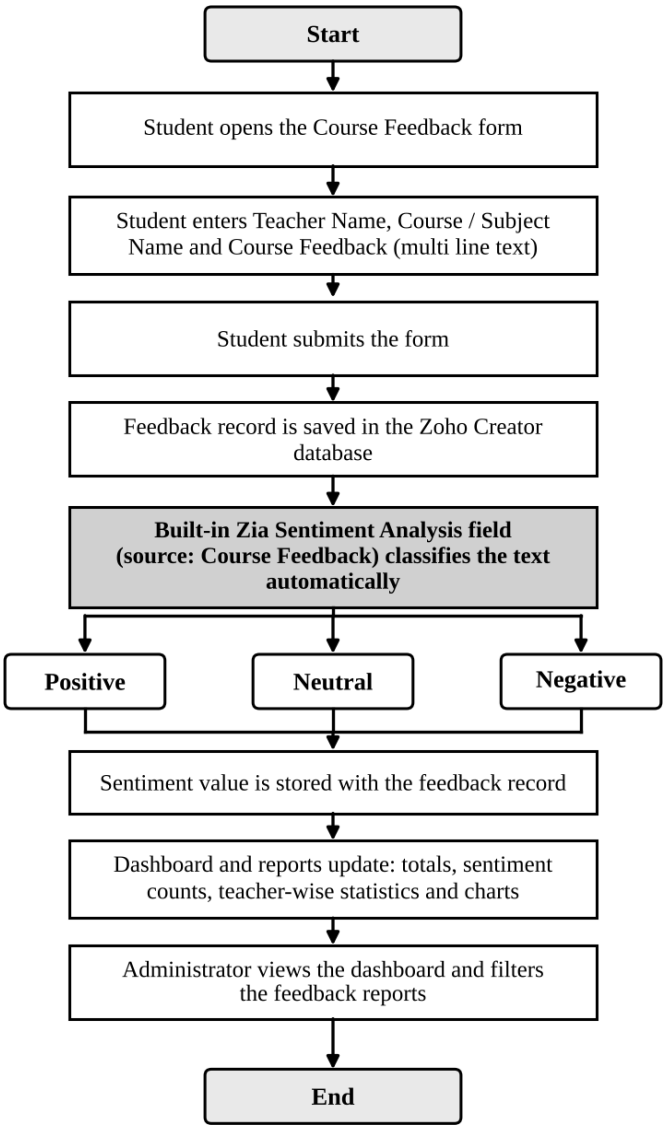

Figure 3.3: Process Flow of Course Feedback Submission and Sentiment Analysis

Figure 3.3 shows the flow of one feedback submission. The student opens the form, enters the three fields and submits. The record is saved, and the built-in Zia Sentiment Analysis field classifies the Course Feedback text as Positive, Negative or Neutral. The sentiment is stored with the record, and the dashboard and reports then include the new record in their counts, statistics and charts.

CHAPTER 4
MODULES DESCRIPTION

The system is divided into six modules. Module 3 contains the AI component, and Modules 4, 5 and 6 use the sentiment that it produces.

4.1 Module 1: Student Feedback Submission

This module provides the form through which students submit course feedback. The Course Feedback form has three fields that the student fills in: Teacher Name, Course / Subject Name and Course Feedback, a multi-line text field for the written comment. The form deliberately has no sentiment dropdown or rating selector, because the sentiment is not chosen by the student. When the form is submitted, the entries are stored as one Course Feedback record in the Zoho Creator database.

The Sentiment Analysis field belongs to the same form. Zoho Creator shows this field as disabled so that a user cannot enter a value in it.

Table 4.1: Fields of the Course Feedback Form

Field	Field Type	Filled By	Purpose
Teacher Name	Dropdown	Student	Identifies the teacher being reviewed
Course / Subject Name	Dropdown	Student	Identifies the course or subject
Course Feedback	Multi line	Student	Written feedback; source field of the sentiment field
Sentiment	Sentiment Analysis (Zia AI field)	Generated automatically	Positive, Negative or Neutral

4.2 Module 2: Teacher and Course Management

This module maintains the teachers and the courses or subjects for which feedback is collected, so that the same names are used in every feedback record and the teacher-wise statistics group correctly. The administrator adds, edits and removes teacher and course entries.

4.3 Module 3: Built-in AI Sentiment Analysis

AI component: Zia Sentiment Analysis field. The Course Feedback form contains a field of type Sentiment Analysis, one of the Zia AI fields provided by Zoho Creator. Its source field is Course Feedback. When a record is saved, the built-in AI feature analyses the text in the source field and stores the result, Positive, Negative or Neutral, in the sentiment field.

This is a ready-made platform feature. No custom machine learning model was developed, trained or deployed for this project. The classification is not produced by keyword rules, conditions or Deluge scripts, and the student does not select it. According to the Zoho Creator documentation, the source field must be a single-line or multi-line field in the same form, the value is estimated by the algorithm, and sentiment analysis can currently be performed on English text (Zoho Corporation, 2026a).

- **Input:** the text of the Course Feedback field.
- **Processing:** the native Zia Sentiment Analysis field of Zoho Creator (natural language processing performed by the platform).
- **Output:** a sentiment label, Positive, Negative or Neutral, stored in the Sentiment field of the record.

4.4 Module 4: Teacher-wise Sentiment Statistics

For every teacher, the application counts the feedback records whose sentiment is Positive, Negative and Neutral. The counts come directly from the stored Teacher Name and the AI-generated Sentiment fields, so no separate classification is performed in this module. Table 4.2 lists the statistics.

Table 4.2: Teacher-wise Sentiment Statistics

Statistic	Definition	Fields Used
Teacher-wise positive feedback	Number of feedback records of a teacher whose Sentiment is Positive	Teacher Name, Sentiment
Teacher-wise negative feedback	Number of feedback records of a teacher whose Sentiment is Negative	Teacher Name, Sentiment
Teacher-wise neutral feedback	Number of feedback records of a teacher whose Sentiment is Neutral	Teacher Name, Sentiment

4.5 Module 5: Administrator Dashboard and Analytics

The administrator dashboard summarises all stored feedback in one view. It shows the overall counts, the teacher-wise statistics of Module 4 and two kinds of charts, as listed in Table 4.3.

Table 4.3: Components of the Administrator Dashboard

Component	Information Displayed
Total feedback submissions	Number of Course Feedback records submitted
Positive, Negative and Neutral counts	Number of records with each AI-generated sentiment
Teacher-wise statistics	Positive, negative and neutral feedback counts for each teacher
Sentiment distribution charts	Share of Positive, Negative and Neutral feedback
Teacher-wise comparison charts	Comparison of sentiment counts across teachers

4.6 Module 6: Feedback Reports and Filtering

This module gives the administrator a report of the stored Course Feedback records, showing the Teacher Name, the Course / Subject Name, the Course Feedback text and the AI-generated Sentiment. The report can be filtered to narrow the records, for example to see only the Negative feedback of one teacher. This lets the administrator read the comments behind the figures shown on the dashboard.

CHAPTER 5

IMPLEMENTATION AND RESULTS

5.1 Experimental Setup

Table 5.1: Software and Hardware Used

Item	Specification
Platform	Zoho Creator
AI service	Native Zia Sentiment Analysis field of Zoho Creator (source field: Course Feedback); no custom machine learning model
Application components	Course Feedback form, teacher and course management, feedback reports, administrator dashboard
Client	Google Chrome (Version 157.0), Windows 10/11 laptop
Sample data	5 teachers, 5 courses and 6 feedback records entered for testing

Development steps:

1. A Zoho Creator application was created.

2. The Course Feedback form was built with the fields Teacher Name, Course / Subject Name and Course Feedback.

3. A Sentiment Analysis field was added to the form with Course Feedback as its source field, and its properties were checked.

4. Teacher and course management was set up.

5. Feedback reports with filters were configured.

6. The administrator dashboard was configured with the counts, teacher-wise statistics and charts.

7. Sample feedback was entered to test the application.

Test procedure. Each module is tested with valid and invalid input, as listed in Table 5.4. Sample comments that clearly express a positive opinion, a negative opinion and a neutral statement are submitted, and the sentiment generated by the Zia field is compared with the expected label.

5.2 Results

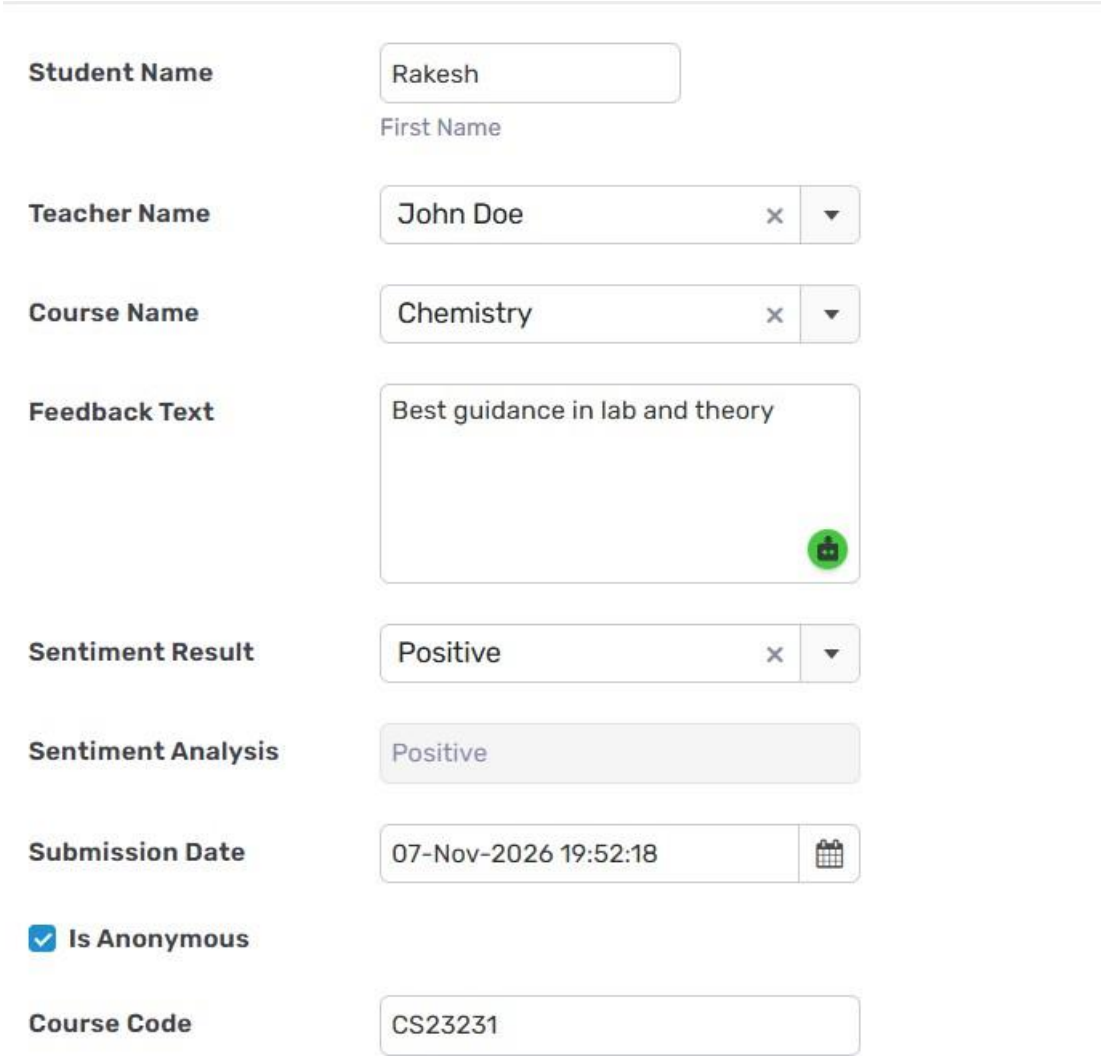

Figure 5.1: Course Feedback Form in Live Mode

Figure 5.2: Zia Sentiment Analysis Field Configuration (Source: Course Feedback)

All Feedback Submissions

Student Name	Teacher Name	Course Name	Feedback Text	Sentiment Result	Submission Date	Feedb...	Is Anonymous	Course Cod
Robert Taylor	John Doe	Physics	Very helpful resources and supportive environment.	Neutral	07-Nov-2026 16:00:00	5	true	BIO201
Maria Garcia	John Doe	English	The assignment was too difficult for our level.	Neutral	07-Nov-2026 09:20:00	4	false	HIST150
James Wilson	Jane Smith	English	Excellent teaching style and clear explanations.	Positive	07-Nov-2026 14:45:00	3	true	ENG302
Sarah Lee	Maria Garcia	Chemistry	Great content but the slides were hard to read.	Positive	07-Nov-2026 11:15:00	2	false	MATH205
Alex Morgan	Jane Smith	History	The lecture was engaging and informative.	Neutral	07-Nov-2026 10:30:00	1	true	CS101
qwert	John Doe	English	good guidance in both theory and laboratory	Positive	07-Nov-2026 18:58:41	6	true	wefwgf

Figure 5.3: Feedback Records with AI-Generated Sentiment

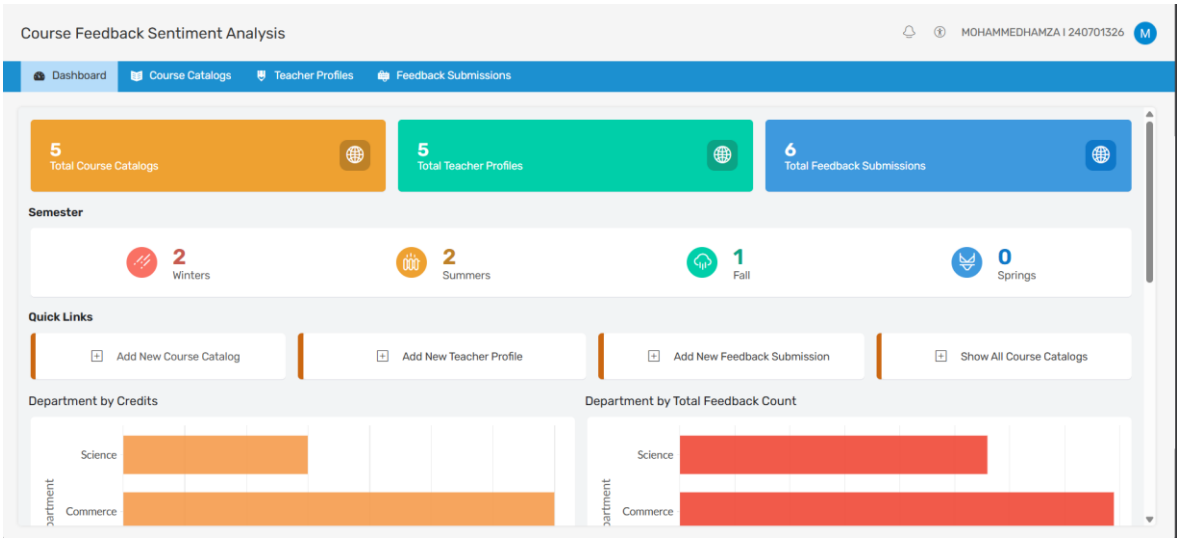

Figure 5.4: Administrator Dashboard: Submission and Sentiment Counts

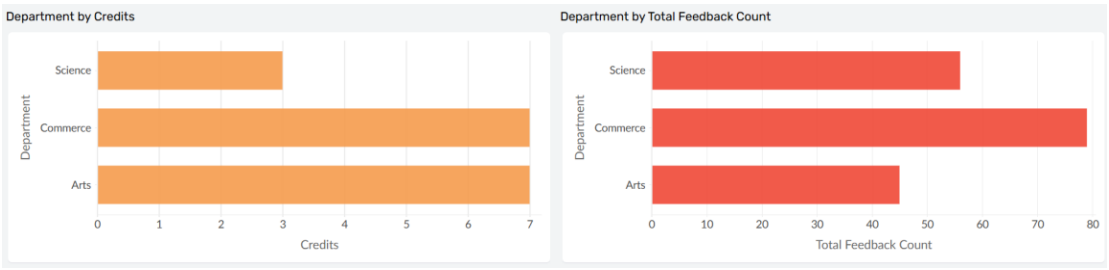

Figure 5.5: Sentiment Distribution Chart.

Table 5.2: Sentiment Summary of the Sample Data

Measure	Count
Total feedback submissions	6
Positive feedback	3
Negative feedback	0
Neutral feedback	3

5.3 Test Cases

Table 5.4 lists the test cases. The expected results describe the intended behaviour of the application.

Table 5.4: Test Cases and Results

ID	Test	Expected Result	Status
TC-01	Open the Course Feedback form	Form shows Teacher Name, Course / Subject Name and Course Feedback; no sentiment dropdown	Pass
TC-02	Try to enter a value in the Sentiment field	Student cannot enter or select a sentiment value	Pass
TC-03	Submit the form with a required field empty	Record not saved; message asks for the missing field	Pass
TC-04	Submit “The teacher explains every topic clearly and the classes are very helpful.”	Sentiment = Positive	Pass
TC-05	Submit “The lectures are confusing and the teacher does not answer questions.”	Sentiment = Negative	Pass
TC-06	Submit “The class is held twice a week in the morning.”	Sentiment = Neutral	Pass
TC-07	Compare the dashboard total with the number of records	Both numbers are equal	Pass
TC-08	Add the Positive, Negative and Neutral counts	Sum equals the total number of submissions	Pass
TC-09	Compare a teacher’s statistics with the filtered report	Counts match	Pass
TC-10	Submit new feedback and refresh the dashboard	Counts and charts include the new record	Pass
TC-11	Open the teacher-wise comparison chart	Every teacher with feedback is shown	Pass
TC-12	Filter the report by Sentiment = Negative	Only Negative records are listed	Pass
TC-13	Filter the report by Teacher Name or Course / Subject Name	Only matching records are listed	Pass

5.4 Discussion

The design ensures that the sentiment is produced by the platform and not chosen by the student, so every record is labelled in the same way. The dashboard and reports turn the labelled records into counts, teacher-wise statistics and charts, and the filters lead back to the individual comments.

The approach has limitations. According to the Zoho Creator documentation, sentiment analysis currently works on English text, so feedback in other languages is outside the

scope of the application (Zoho Corporation, 2026a). The label is an estimate made by the platform and is limited to Positive, Negative and Neutral, and the accuracy of the labels was not independently evaluated in this project. The label shows the overall tone of a comment but not the reason for it, so the administrator still needs to read the comments behind the counts.

5.5 Existing System versus Proposed System

Table 5.5: Existing System versus Proposed System

Parameter	Existing System (typical manual feedback)	Proposed System
Collecting feedback	Paper forms or general-purpose online forms	One Zoho Creator form with three fields
Sentiment of a comment	Judged by reading, or chosen by the student from a list	Generated automatically by the Zia Sentiment Analysis field; not chosen by the student
Consistency	Depends on the person reading the comment	The same built-in AI feature labels every record
Teacher-wise summary	Compiled by hand	Teacher-wise positive, negative and neutral statistics
Charts	Built manually, if at all	Sentiment distribution and teacher-wise comparison charts
Reports and filtering	Manual sorting of records	Feedback reports with filters

CHAPTER 6
CONCLUSION AND FUTURE WORK

6.1 Conclusion

This project developed Course Feedback Sentiment Analysis, a Zoho Creator application that collects student course feedback through a simple three-field form and classifies every submission automatically. The classification is performed by the native Zia Sentiment Analysis field of Zoho Creator, configured with Course Feedback as its source field, so students never choose a sentiment and no custom machine learning model, keyword rule or script was needed. The administrator dashboard turns the stored records into the total and sentiment-wise counts, teacher-wise positive, negative and neutral statistics, sentiment distribution charts and teacher-wise comparison charts, and the filterable reports lead from these figures back to the individual comments.

The project shows that a useful AI-assisted application can be assembled on a low-code platform by configuring a built-in AI feature instead of training a model. Its main limitations are that the AI label is an estimate limited to three values, that the field currently supports English text, and that the accuracy of the labels was not independently evaluated.

6.2 Future Work

- Evaluate the accuracy of the AI labels by comparing them with manual labels on a sample of comments.
- Add the keyword extraction AI field of Zoho Creator to show the topics that students mention most often.
- Add semester-wise or date-wise trend charts to show how the sentiment for each teacher changes over time.
- Send an email alert to the administrator when a Negative feedback record is submitted.
- Add a numeric rating beside the written comment, and support other languages when the platform supports them.
